

Why are recycled PET (rPET) bags a better choice for Earth Day or any day?

Simply put: They are better for the environment!

Conserving resource materials used in bags is as important as conserving gas in your car! When EDGE bags are produced, post consumer PET materials from recycled water bottles are used, with no petroleum components added! Using more recycled content reduces the need for petroleum based resin, which depletes our natural resources and raises oil consumption.

Compare our line of 100% recycled products to other reusable totes. Being made of 100% recycled PET is truly an eco sales advantage when compared to the common Non-Woven Polypropylene or NWPP bags. Most NWPP bags contain no "post-consumer" recycled waste and instead use mostly petroleum-based materials to produce their non-woven polypropylene (NWPP) bags.

It is also the most responsible fully recyclable choice: PET is the most readily accepted material for recycling with an infinite life cycle and recycle potential! The end result? We offer an eco-responsible and cost-effective product using materials that would have otherwise gone into landfills.

Using reusable products is another important step in conserving our environment. Your purchase of our reusable totes made of 100% post-consumer recycled content, means that you and your company ultimately support the recycling process responsibly! We thank you!
